

Executive Summary

ENTSO-E Summer Outlook 2026 highlights an overall favourable adequacy situation in Europe for the coming summer, with no systemic risks for most of the power system. Structural adequacy risks are identified in Moldova, mainly due to gas supply constraints, import dependency, weak interconnections and exposure to regional disturbances. Specific risks may also occur in Ireland, Malta and Cyprus due to a combination of outages, limited import capacity and low backup availability. Growing renewables, doubled battery storage and close TSO coordination support system security.

Your Questions, Our Answers

► What is the Seasonal Outlook?

► How are electricity TSOs preparing to maintain security of supply?

► Does the Seasonal Outlook consider the probability and impact of a heat wave?

► What are non-market resources?

► What are operational mitigation measures?

► What are Loss of Load Expectation and Expected Energy Not Served?

► How are ENTSO-E neighbouring countries considered in the Seasonal Outlook?
